

1. A simple pendulum may be used to determine a value for the acceleration of free fall  $g$ .

Measurements are made of the length  $L$  of the pendulum and the period  $T$  of oscillation.

The values obtained, with their uncertainties, are as shown.

$$T = (1.92 \pm 0.02) \text{ s}$$

$$L = (91 \pm 1) \text{ cm}$$

(a) Calculate the percentage uncertainty in the measurement of

(i) the period  $T$ ,

$$\begin{aligned} &= \frac{\Delta T}{T} \times 100\% \\ &= \frac{0.02}{1.92} \times 100\% \\ &= 1.04\% \text{ -----A(1)} \end{aligned}$$

$$\text{uncertainty} = \dots\dots\dots 1.04\dots\dots \% \text{ [1]}$$

(ii) the length  $L$ .

$$\begin{aligned} &= \frac{\Delta L}{L} \times 100\% \\ &= \frac{1}{91} \times 100\% \\ &= 1.10\% \text{ -----A(1)} \end{aligned}$$

$$\text{uncertainty} = \dots\dots\dots 1.10\dots\dots \% \text{ [1]}$$

(b) The relationship between  $T$ ,  $L$  and  $g$  is given by

$$g = \frac{4\pi^2 L}{T^2}$$

Using your answers in (a), calculate the percentage uncertainty in the value of  $g$ .

$$\begin{aligned} \frac{\Delta g}{g} \times 100\% &= \frac{\Delta L}{L} \times 100\% + 2 \frac{\Delta T}{T} \times 100\% \\ &= 1.10\% + 2(1.04\%) \dots\dots\dots \text{C(1)} \\ &= 3.2\% \text{ ----A(1)} \end{aligned}$$

$$\text{uncertainty} = \dots\dots 3.2\% \text{ [2]}$$

(c) The values of  $L$  and  $T$  are used to calculate a value of  $g$  as  $9.745 \text{ m s}^{-2}$ .

By reference to the measurements of  $L$  and  $T$ , suggest why it would not be correct

to quote the value of  $g$  as  $9.745 \text{ m s}^{-2}$ .

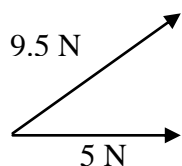

..values have more s.f than data ----- (B2)

Or actual uncertainty is  $\pm 0.3 \text{ m s}^{-2}$  -----(B2) [2]

(b) An object is acted upon by two forces at right angles to each other. One of the forces has a magnitude of  $5.0 \text{ N}$  and the resultant force produced on the object is  $9.5 \text{ N}$ .

Determine

(i) the magnitude of the other force,

$$F = \sqrt{(9.5)^2 - 5^2} \text{ ----C(1)}$$

$$= 8.1 \text{ N} \text{ ----A(1)}$$

force = 8.1N [2]

(ii) the angle between the resultant force and the  $5.0 \text{ N}$  force.

$$\cos \theta = \frac{5}{9.5} \text{ -----C(1)}$$

$$\theta = 58^\circ \text{ ----A(1)}$$

angle = 58° [2]

- 2 (a) Complete Fig. 2.1 to show whether each of the quantities listed is a vector or a scalar.

	vector/scalar
distance moved	scalar ..... B1
speed	scalar ..... B1
acceleration	vector ..... B1

**Fig 2.1**

[3]

- (b) A ball falls vertically in air from rest. The variation with time  $t$  of the distance  $d$  moved by the ball is shown in Fig. 2.2

**Fig. 2.2**

(i) By reference to Fig. 2.2, explain how it can be deduced that

1. the ball is initially at rest,  
 gradient (of graph) is the speed/velocity (can be scored here or in 2) ..... B1  
initial gradient is zero ..... B1 [2]

2. air resistance is not negligible.  
 .... gradient (of line/graph) becomes constant ..... B1 [1]

(ii) Use **Fig. 2.2** to determine the speed of the ball at a time of 0.40 s after it has been released.

speed =  $(2.8 \pm 0.1) \text{ ms}^{-1}$  ..... A2 [2]  
 (if answer  $> \pm 0.1$  but  $\leq \pm 0.2$ , then award 1 mark)

(iii) On Fig. 2.2, sketch a graph to show the variation with time  $t$  of the distance  $d$  moved by the ball for negligible air resistance. You are not expected to carry out any further calculations. [3]

curved line never below given line and starts from zero ..... B1  
 continuous curve with increasing gradient ..... B1  
 line never vertical or straight ..... B1 [3]

3 (a) State the relation between force and momentum.

. force = rate of change of momentum ..... (allow symbols if defined) ..... B1 [1]

(b) A rigid bar of mass 450g is held horizontally by two supports A and B, as shown in Fig. 3.1.

**Fig. 3.1**

The support A is 45 cm from the centre of gravity C of the bar and support B is 25 cm from C.

A ball of mass 140 g falls vertically onto the bar such that it hits the bar at a

distance of 50 cm from C, as shown in Fig. 3.1.

The variation with time  $t$  of the velocity  $v$  of the ball before, during and after hitting the bar is shown in Fig. 3.2

**Fig. 3.2**

For the time that the ball is in contact with the bar, use Fig. 3.2

- (i) to determine the change in momentum of the ball,

$$\Delta p = 140 \times 10^{-3} \times (5.5 + 4.0) \quad \text{C1}$$

$$= 1.33 \text{ kg m s}^{-1} \quad \text{A1} \quad [2]$$

- (ii) to show that the force exerted by the ball on the bar is 33 N.

$$\text{force} = 1.33 / 0.04 \quad \text{M1}$$

$$= 33.3 \text{ N} \quad \text{A0} \quad [1]$$

- (c) For the time that the ball is in contact with the bar, use data from Fig. 3.1 and (b)(ii) to calculate the force exerted on the bar by

- (i) the support A,

$$\text{taking moments about B} \quad \text{C1}$$

$$(33 \times 75) + (0.45 \times g \times 25) = F_A \times 20 \quad \text{C1}$$

$$F_A = 129 \text{ N} \quad \text{A1} \quad [3]$$

(ii) the support B.

$$F_B = 33 + 129 + 0.45g$$

$$= 166 \text{ N}$$

C1  
A1 [2]

5 (a) must show working ..... M1  
 $v = 30.6 \text{ m s}^{-1}$  ..... A0

(b)(i)  $W = 750 \times 10 \times 10^3$  ..... C1  
 $= 7.5 \times 10^6 \text{ J}$  ..... A1

(ii) output power  $P = 750 \times 30.6$  ..... C1  
 $= 2.30 \times 10^3 \text{ W}$  ..... A1

(III) Input power  $= \frac{100}{30} \times 2.30 \times 10^3$  ..... C1  
 $= 7.67 \times 10^3 \text{ W}$

6 (a) Elastic deformation: no permanent extension after force is removed  
 Plastic deformation: permanent extension after force is removed. B1

Elastic deformation: energy is recovered  
 Plastic deformation: energy lost as heat ..... B1

(b) each graph correct ..... B1  
 .....  
**(Total : B3)**

7 (a)(i)  $f = 1/(5 \times 10^{-3})$  ..... C1  
 $= 200 \text{ Hz}$  ..... A1

(ii)  $I \propto A^2$ , or other working ..... C1  
 Amplitude  $= \frac{1}{2} A$  ..... A1

(b) Graph sketched has : correct amplitude ..... B1  
 Same frequency as  $T_1$  ..... B1  
 Phase difference correct ..... B1

8(a)(i) monochromatic light: light of single value of wavelength ..... B1

(ii) Coherent: constant phase difference ..... B1

$$(b) \lambda = \frac{xa}{D} = \frac{2.0 \times 10^{-3} \times 0.60 \times 10^{-3}}{2.0} \dots\dots\dots C1$$

$$= 6.0 \times 10^{-7} \text{ m} \dots\dots\dots A1$$

9 (a) at least 3 parallel lines, equal separation apart, perpendicular to plate ..... B1

$$(b) \text{ electric field } e = \frac{300}{25 \times 10^{-3}} = 12,000 \text{ NC}^{-1} \dots\dots\dots C1$$

$$\text{Force} = 1.60 \times 10^{-19} \times 12000 \dots\dots\dots C1$$

$$= 1.92 \times 10^{-15} \text{ N} \dots\dots\dots A1$$

$$(c) (i) 1.92 \times 10^{-15} = 9.11 \times 10^{-31} a \dots\dots\dots C1$$

$$a = 2.11 \times 10^{15} \text{ ms}^{-2} \dots\dots\dots A1$$

$$(ii) v^2 = 0 + 2 \times 2.11 \times 10^{15} \times 25 \times 10^{-3} \dots\dots\dots C1$$

$$v = 1.03 \times 10^7 \text{ ms}^{-1} \dots\dots\dots A1$$
